

Assignment 1 — Mongoose Schema & Validation

Concept: Schema design, field types, built-in validators

Level	Easy
Time	45 minutes
File banani hai	src/model/reviewModel.js

Kya seekhoge

- Mongoose schema me kaunsa field kis type ka hota hai
- required, min, max, enum, default, trim, unique ka fark
- Custom error message kaise dete hain
- Validation DB level pe kyun zaroori hai (sirf frontend pe kyun nahi)

Problem

Ek **Review** model banao. Customer product ka review likhega.
Har review me ye hona chahiye:

Field	Type	Rules
title	String	required, 3-80 characters, trim
comment	String	required, 10-500 characters, trim
rating	Number	required, 1 se 5 ke beech, poora number ho (2.5 nahi)
reviewerName	String	required, 2-50 characters, trim
status	String	sirf "pending", "approved", "rejected" — default "pending"
isVerifiedPurchase	Boolean	default false

Requirements

- src/model/reviewModel.js file banao.
- Har required field pe **apna custom error message** likho. Default message "Path title is required" user ko samajh nahi aata.
- rating sirf **whole number** le — 3.5 reject hona chahiye. (Hint: custom validator + Number.isInteger)
- status ka galat value dene pe message aisa aaye: "blocked is not a valid status" (Hint: enum me {VALUE} placeholder use kar sakte ho)
- Schema me timestamps: true lagao — createdAt aur updatedAt apne aap ban jaayenge.
- Model export karo: mongoose.model("review", reviewSchema)

Test kaise karoge

Ek chhoti test file banao (test.js) aur ye 4 cheezein try karo:

```
// 1. Sahi data -> save ho jaana chahiye
await ReviewModel.create({
  title: "Bahut accha product",
  comment: "Delivery fast thi aur quality bhi acchi hai",
  rating: 5,
  reviewerName: "Rahul",
});

// 2. rating = 6      -> error aana chahiye
// 3. rating = 3.5    -> error aana chahiye
// 4. status = "blocked" -> error aana chahiye
```

Soch ke batao (likh ke laana)

1. Frontend pe already validation laga di hai. Phir schema me dobara kyun?
2. `trim: true` na lagao to `" Rahul "` aur `"Rahul"` ko DB alag maanega ya same?
3. `default: "pending"` aur `required: true` — dono ek saath lagana theek hai kya? Kya hoga agar dono laga do?

Bonus (optional)

- Ek aur field jodo: `helpfulCount` (Number, default 0, negative nahi ho sakta).
- `comment` ke liye aisa custom validator likho jo **khaali space** wali string reject kare (jaise `" "` — length to 10 hai, par hai to khaali).
