

# Assignment 2 — Joi Validation Layer

Concept: Request validation, body vs query vs params, stripUnknown

|                 |                                                |
|-----------------|------------------------------------------------|
| Level           | Easy-Medium                                    |
| Time            | 1 hour                                         |
| File banani hai | src/validationSchema/reviewValidationSchema.js |
| Zaroori         | Assignment 1 ka reviewModel.js                 |

## Kya seekhoge

- Joi aur Mongoose validation me **fark kya hai**, dono kyun chahiye
- body / query / params — teeno alag-alag validate kaise hote hain
- stripUnknown se **mass assignment** bug kaise rukta hai
- default() aur convert kaise kaam karte hain

## Problem

Assignment 1 wale Review model ke liye **Joi schemas** likho, aur unhe `validationMiddleware` se jodo.

## Requirements

### 1. createReviewSchema (body)

- title — required, 3-80 chars, trim
- comment — required, 10-500 chars, trim
- rating — required, integer, 1-5
- reviewerName — required, 2-50 chars, trim

**Dhyaan do:** `status` aur `isVerifiedPurchase` is schema me **NAHI** honi chahiye. Socho kyun — agar user body me `{"status": "approved"}` bhej de to kya hoga?

### 2. getReviewsSchema (query)

- status — optional, sirf 3 valid values
- minRating — optional, number, 1-5
- page — optional, integer, min 1, **default 1**
- limit — optional, integer, min 1, **max 20**, default 10

### 3. reviewIdSchema (params)

- id — required, valid MongoDB ObjectId (24 character hex)

### 4. updateReviewSchema (body)

- Wahi 4 fields, par koi bhi **required** nahi (PATCH partial update hai)
- Poora object khaali nahi ho sakta — kam se kam 1 field aani chahiye

## Rules jo follow karne hain

- Joi ke rules Mongoose ke rules se BILKUL match karne chahiye.** Agar model me `maxLength: 80` hai to Joi me bhi `max(80)` — 75 nahi, 85 nahi.
- `limit` pe `max(20)` lagana **mat bhoolna**.
- Har schema ke upar ek comment likho: *"ye kaunsi API ke liye hai"*.

## Route me lagao

```
router.post("/createReview",
  validationMiddleware(createReviewSchema),          // body (default)
  reviewController.createReview);

router.get("/getReviews",
  validationMiddleware(getReviewsSchema, "query"),    // <- dusra argument
  reviewController.getReviews);
```

## Test kaise karoge

| Kya bhejo                                         | Kya milna chahiye                           |
|---------------------------------------------------|---------------------------------------------|
| Sahi body                                         | 201                                         |
| <code>rating: 9</code>                            | 400 + saaf message                          |
| <code>title</code> bheja hi nahi                  | 400                                         |
| <code>?limit=500</code>                           | 400                                         |
| <code>?limit=5</code> (string aayi thi)           | Controller me <b>number 5</b> milna chahiye |
| Body me extra field <code>{"hacked": true}</code> | Save nahi hona chahiye, error bhi nahi      |

## Soch ke batao

1. Mongoose me validation hai hi — Joi ki alag se kya zaroorat? **Do** solid reason likho.
2. `?limit=5` bhejne pe `req.query.limit` string aati hai ya number? Kyun?
3. `stripUnknown: true` na lagayein to `{"status": "approved"}` bhejne pe kya hoga?
4. Ek user `{"rating": 6, "title": "x"}` bhejta hai — **dono** galat hain. Kya user ko dono errors ek saath milenge? Kaunsi Joi setting decide karti hai?

## Bonus

`minRating` aur `maxRating` dono add karo, aur aisa rule lagao ki `maxRating` hamesha `minRating` se **bada** hi ho. (Hint: `joi.ref()` )
